

Retail Business Performance & Profitability Analysis

Business Insights Report

Project Overview

This project analyzes the Global Superstore retail dataset to evaluate business performance across product categories, markets, regions, and time periods. The objective is to identify sales trends, profitability drivers, and opportunities for business improvement using SQL, Power BI, and DAX.

Executive Summary

The retail business generated a total sales revenue of **₹12.64 Million** and a total profit of **₹1.47 Million** from approximately **25,000 customer orders** between **2011 and 2014**. The overall profit margin is **11.62%**, indicating healthy business performance.

Key Business Insights

1. Technology is the Highest Performing Category

- Total Sales: **₹4.74 Million**
- Total Profit: **₹664K**

Technology products contributed the highest revenue and profit among all product categories, making them the primary driver of business growth.

2. Copiers are the Most Profitable Sub-Category

The Copiers sub-category generated the highest profit, followed by Phones and Bookcases. These products should receive greater marketing attention and inventory investment.

3. APAC Leads Market Sales

The APAC market contributes approximately **28%** of total sales, making it the strongest-performing market. Maintaining customer satisfaction and expanding market share in this region can further improve revenue.

4. Strong Seasonal Sales Trend

Sales gradually increase throughout the year and reach their peak during **November and December**. This indicates higher customer demand during the year-end shopping season.

5. Furniture Requires Improvement

Although Furniture generates significant sales, its profitability is considerably lower than Technology and Office Supplies. Pricing strategy, discounts, and operational costs should be reviewed to improve margins.

Business Recommendations

- Increase investment in high-profit Technology products.
 - Promote Copiers and Phones through targeted marketing campaigns.
 - Review discount strategies for Furniture products.
 - Prepare inventory in advance for year-end demand.
 - Expand customer acquisition and retention initiatives in the APAC market.
-

Tools Used

- MySQL
 - Power BI
 - DAX
 - Microsoft Excel
-

Conclusion

The analysis demonstrates how data-driven decision-making can identify profitable product categories, high-performing markets, and seasonal demand patterns. The insights generated from this dashboard can support inventory planning, marketing strategy, and executive business decisions.
